

Screenshots of the Biometric App

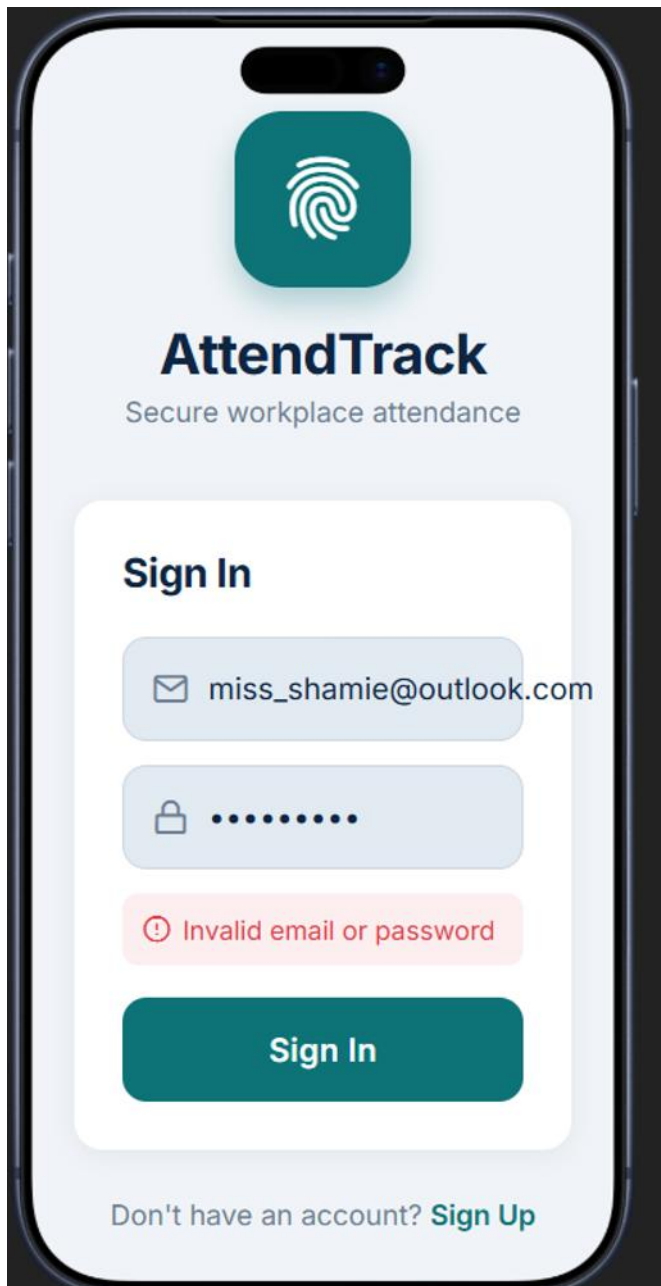

Signup Screen with email validation as well as password setup screen:

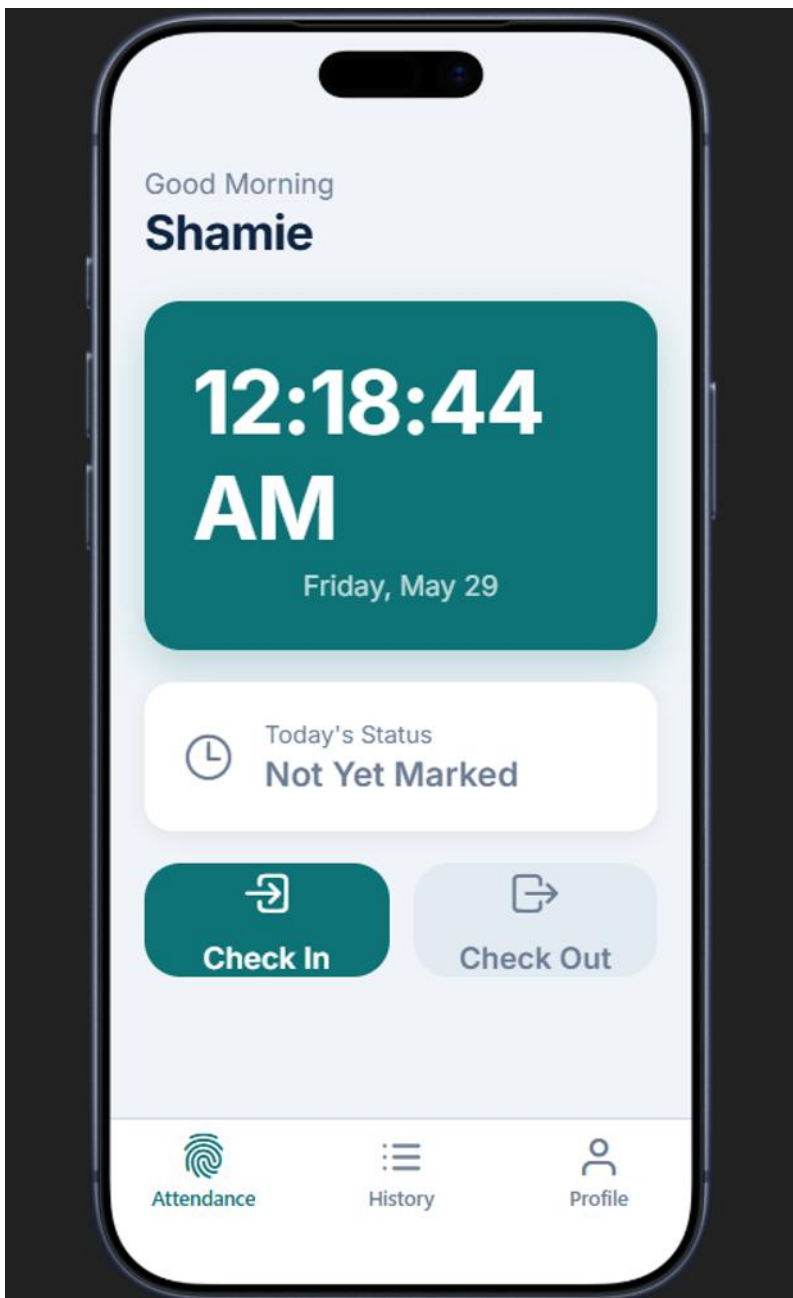

Sign in Screen:

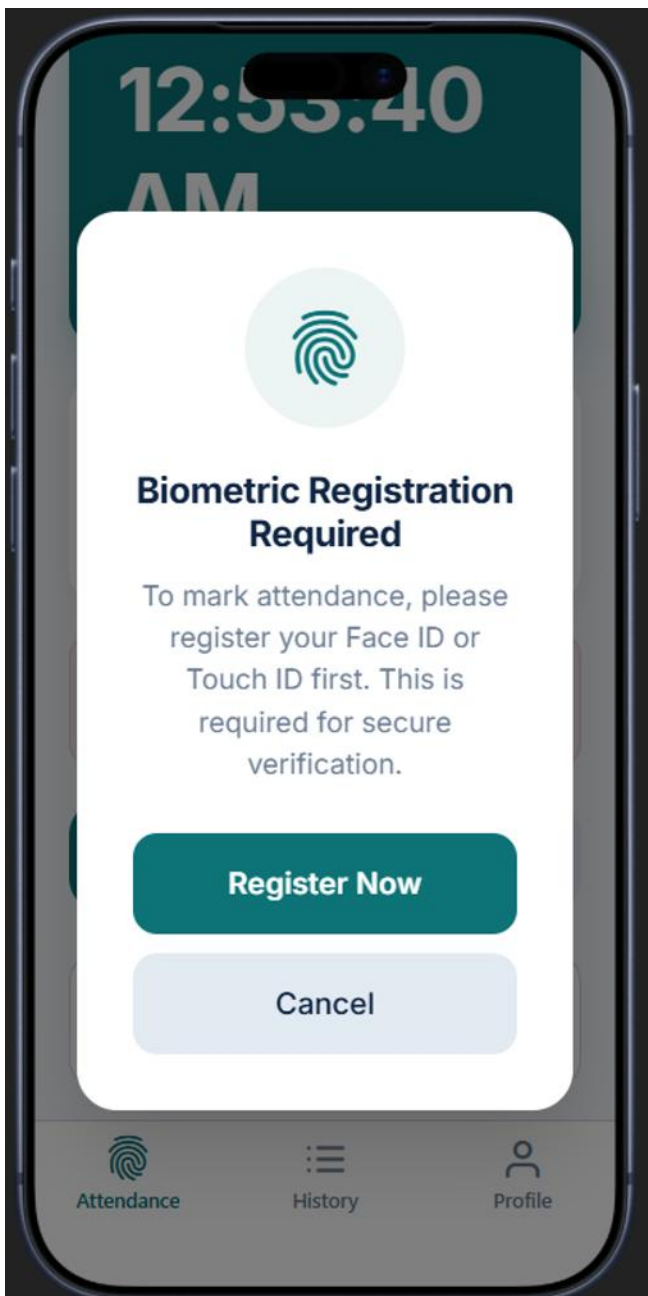

Sign-in screen showing failure (for using the wrong credentials):

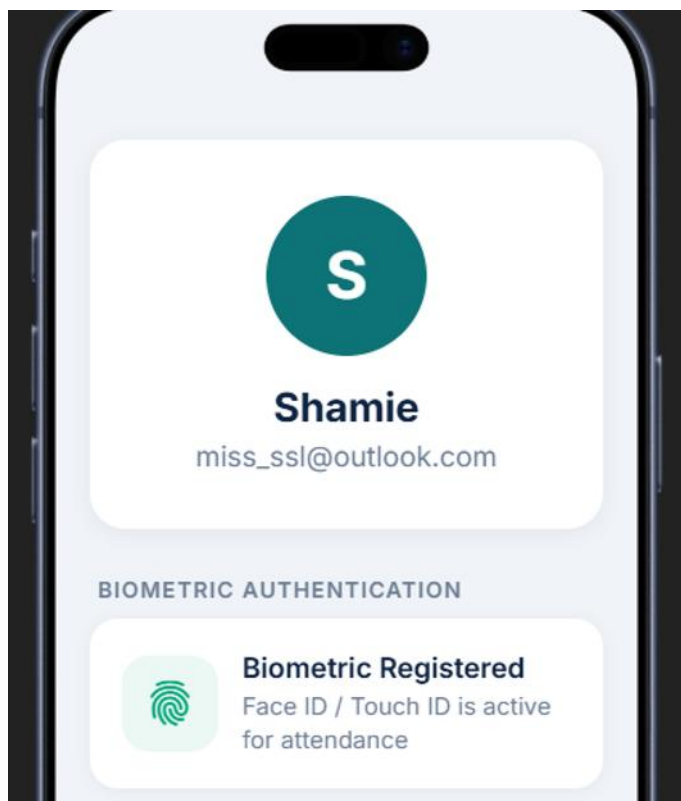

Home screen with check-in/check-out buttons

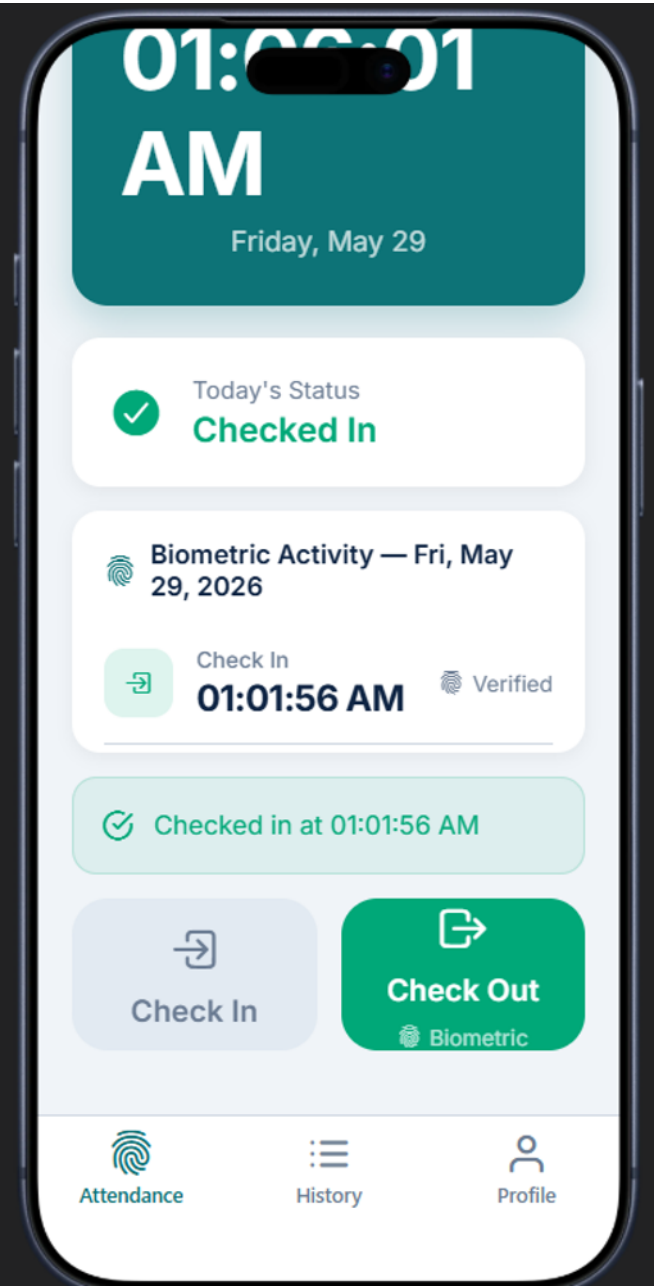

Biometric showing not registered (using LocalAuntentication)

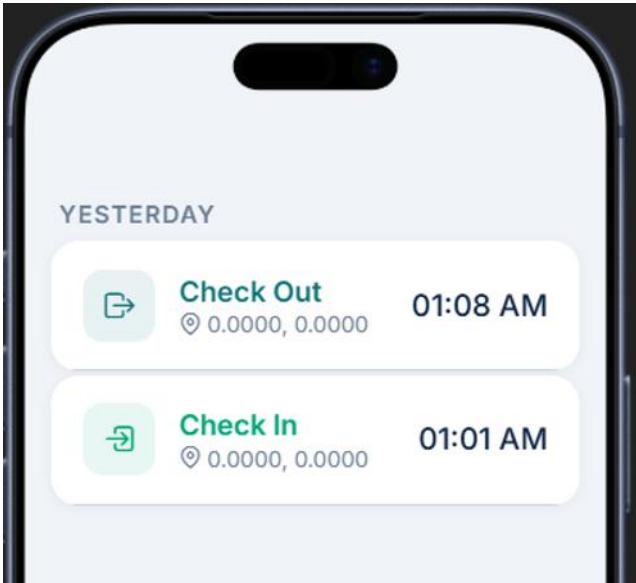

Biometric registered successfully (using CoreLocation):

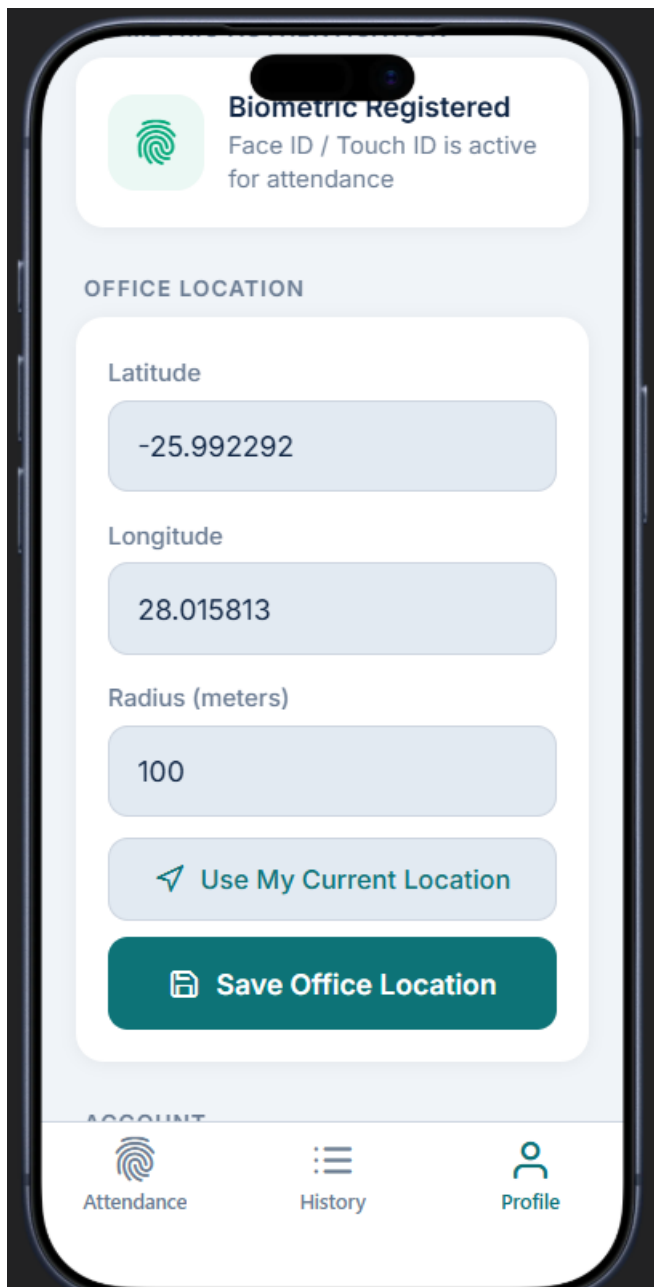

Check-in/out with timestamp, including notification for “checked in today”

View attendance, previous check-in/out record(s)

Location checking:

The image shows a mobile application interface for location checking. At the top, there is a status bar with a black pill-shaped notch. Below the notch is a green circular icon with a fingerprint symbol. To its right, the text "Biometric Registered" is displayed in bold, followed by "Face ID / Touch ID is active for attendance" in a smaller font. Below this is a section titled "OFFICE LOCATION" in bold. Under this title, there are three input fields: "Latitude" with the value "-25.992292", "Longitude" with the value "28.015813", and "Radius (meters)" with the value "100". Below these fields are two buttons: "Use My Current Location" with a location pin icon and "Save Office Location" with a save icon. At the bottom of the screen is a navigation bar with three icons: a fingerprint icon labeled "Attendance", a list icon labeled "History", and a person icon labeled "Profile".

Screenshots Output of the Error Handling Code

Output value to test: "success"

```
iOS Networking Demo with Complete Error Handling
=====
Fetching todos from API...
SUCCESS: Data fetched successfully!
Received 4 todo items
First 3 todos:
  • Buy groceries
    [ID: 1 | Status: PENDING]
  • Walk the dog
    [ID: 2 | Status: COMPLETED]
  • Study Swift
    [ID: 3 | Status: PENDING]
=====
Error handling demonstration complete
All network error cases are handled gracefully
```

Output value to test: "noInternet"

```
iOS Networking Demo with Complete Error Handling
=====
Fetching todos from API...
ERROR: No internet connection detected
Solution: Please check your Wi-Fi or cellular connection
The app will work offline using cached data
=====
Error handling demonstration complete
All network error cases are handled gracefully
```

Output value to test: "noData"

```
Fetching todos from API...
ERROR: Server returned no data
  Solution: The API endpoint may be temporarily unavailable
  Try again later or contact support
=====
Error handling demonstration complete
All network error cases are handled gracefully
=====
[ ]
```

Output value to test: "invalidResponse"

```
iOS Networking Demo with Complete Error Handling
=====
Fetching todos from API...
ERROR: Server returned an invalid response
  Solution: The server might be down or misconfigured
  Status code indicates a problem on the server side
=====
Error handling demonstration complete
All network error cases are handled gracefully
=====
```

Output value to test: "decodingFailed"

```
iOS Networking Demo with Complete Error Handling
=====
Fetching todos from API...
ERROR: Failed to decode the response data
  Solution: The data format may have changed
  Check if the API structure matches the expected model
=====
Error handling demonstration complete
All network error cases are handled gracefully
